The Excel vacuum press kit is incredibly powerful and is a testament to the virtue of simplicity. With its wide range of uses, you'll find it a versatile and practical addition to your arsenal of tools. The Excel 3™ is designed for vacuum bags up to 4’ x 9’ and the Excel 5™ is suitable for bags as large as 4’ x 15’. We recently redesigned this system with several updated parts and new features to make this the most versatile and affordable vacuum press available.

This kit is designed for woodworkers looking for a simple and affordable method of veneering wood panels and clamping wood projects for routing, sanding, and carving. With an integrated vacuum valve, the system is fully adjustable and can create more than 1,785 lbs of pressure per square foot at sea level. At the heart of the system is a very powerful vacuum pump designed to ensure many years of trouble-free operation.

I hope you find the assembly process to be very easy. This guide will help get your vacuum press put together as quick as possible. As always, feel free to contact me through my website at VeneerSupplies.com if you have any questions.

**Assembly Time:** 30 - 35 minutes

**Assembly Tools:**
- Cross-Tip Screw Driver
- Pliers or Vise Grips
- 1/4" Allen Wrench
- Razor Knife
- Marking Pen
Excel Vacuum Press Kit Parts List

Heavy-Duty Vacuum Pump

- Running Amps: 3.7 (approx.)
- Port size: 1/4 NPT
- Sound Rating: 63 dB
- Cylinder: Wetted Aluminum Alloy
- Design: Oil-less Double Rocking Piston
- Maximum Bag Pressure: 1,785 lbs/sq ft
- Maximum Vacuum: 25.5" Hg at Sea Level

Optional Manifold Kit with Quick Connectors
This additional parts kit allows the pressing of 3 vacuum bags at the same time. This optional kit must be selected when your order on our website.

Warning: Brass products may contain chemicals known to the state of California to cause cancer or reproductive toxicity. Visit www.p65warnings.ca.gov for details.
PLEASE READ THIS SECTION CAREFULLY. IT CONTAINS A BINDING ARBITRATION CLAUSE THAT MAY SIGNIFICANTLY AFFECT YOUR LEGAL RIGHTS, INCLUDING YOUR RIGHT TO FILE A LAWSUIT IN COURT AND TO HAVE A JURY HEAR YOUR CLAIM(S).

The wording "We", "Us" and "Our" shall herein include JWW Services Inc., JoeWoodworker.com, VeneerSupplies.com, and its representatives, owners, and employees. Your use of this product is governed by the policies, terms and conditions set forth below and such use of the content and principles indicates your acceptance of these terms and conditions. These terms and conditions shall supersede any subsequent terms or conditions. JWW Services Inc. reserves the right to make changes to these terms and conditions at any time.

We do not make representations or give warranties regarding the use of this article. All content is provided for use as is without warranty of any kind. User indemnifies and holds JWW Services Inc. harmless from any and all actions, civil or criminal, claims, liabilities, and losses including our attorney fees, arising out of the use of this instruction set. The contents of this document are to be considered informational only and that which is not from an expert. This document, provided by JWW Services Inc., is non-expert opinion only and offered without warranty. You are solely responsible for your access to, use of and/or reliance on any content. You agree to conduct any necessary, appropriate, prudent, or judicious investigation, inquiry, research, and due diligence with respect to the safe and appropriate use of its contents.

JWW Services Inc. shall not assume any responsibility for any incident, accident, or other harmful occurrence in regard to the information or use of the information contained in this document. No warranty or representation, either expressed or implied, is made with respect to the quality, accuracy, safety or fitness for any part of this document. In no event shall we be liable for direct, indirect, special, incidental, or consequential damages arising from any information contained herein. The user/builder/owner of the system shall assume all risk. The full or partial assembling of this system is an agreement that you will not hold us liable for any circumstances or costs that may arise from the use of these parts and this system.

It is also agreed that we do not provide any form of insurance of fitness of this device for any use: commercial or otherwise. You hereby agree to hold us harmless for any mishap, injury, or untoward occurrence. Users of this document and the equipment described herein do so at their own risk and assume complete responsibility for the use of that information and equipment by themselves or others. We are not responsible for any personal injuries to the user/builder/owner or others associated with its use, or property damage resulting from building or operating the equipment described herein. Maintaining equipment and evaluating its suitability for a specific situation are the sole responsibilities of the user/builder/owner. You agree to use the information contained in this document at your own risk and to use good judgment during the use of the equipment described in this document at all times and to work safely within your own abilities.

We shall not be held responsible for typographical errors. The products contained in this kit are distributed, but not manufactured, by VeneerSupplies.com.

Resolution of Claims or Disputes
Any dispute or clam between you and Us arising in any way out of the use of this site or any product contained within this site will be resolved by BINDING ARBITRATION, rather than in a court. This obligation applies to both parties, regardless of the legal theory or cause of action involved (tort, product liability, misrepresentation, negligence, etc.). Both you and Us agree to waive the right to bring a lawsuit to be decided by judge or jury regarding any such claims or disputes, and instead agree to have such claims or disputes resolved by an arbitrator.

Governing Law
The arbitrator shall be agreed upon by the parties and the arbitration shall take place in Harford County, Maryland in accordance with Maryland law.

Procedure
If the parties cannot agree on a mutually acceptable arbitrator, the arbitration will be conducted through the American Arbitration Association ("AAA") and in accordance with its rules. The AAA’s rules are available to view at https://www.adr.org. Both parties agree to equally share the administrative expense of the arbitration, unless the arbitrator finds that the claim was brought in bad faith and orders one party to pay the cost of the proceedings as part of the arbitration award. Both parties are responsible for paying the costs of their own counsel, experts, and witnesses. Judgment on the award rendered by the arbitrator may be entered in any court having jurisdiction thereof. Before commencing an arbitration under this Agreement, the aggrieved party will first present the claim or dispute to the opposing party by (certified mail, regular mail). Our notice address to submit claims or disputes is: JWW Services Inc., 217 E. Jarrettsville Rd., Suite 5, Forest Hill, MD 21050. If the claim or dispute is not resolved within 90 days, the aggrieved party can commence arbitration proceedings in accordance with this Agreement.

Class Action Waiver
All arbitrations conducted under this Agreement shall be conducted only on an individual (and not a class-wide) basis; and an arbitrator shall have no authority to award class-wide relief. Your use of this document indicates your acceptance that this Agreement specifically prohibits you from commencing arbitration proceedings as a representative of others or joining in any arbitration proceedings brought by any other person.

Severability
If any part of any provision of this Agreement shall be finally determined to be invalid or unenforceable under applicable law, that part shall be ineffective to the extent of such invalidity or unenforceability only, without in any way affecting the remaining parts of said provision or the remaining provisions of this Agreement.

Proposition 65 Warning (Assembly Bill 1953) To California and Other Applicable States
This warning is provided to comply with California’s Proposition 65 (Assembly Bill 1953) product labeling law and may apply to other states. Brass fittings and other products may contain chemicals known to the state of California to cause cancer, birth defects or other reproductive harm. Brass fittings may contain lead and are not for use with potable water. As with any product of this nature, we recommend washing your hands after contact with brass parts. We provide this warning based on our knowledge concerning the possible presence of one or more such chemicals, without attempting to evaluate the level of exposure. Visit www.p65warnings.ca.gov for details.
Before You Begin
There are a few things to know before you begin working on the Excel 1 kit. Please read each of the following topics carefully. Don't skip this section because it outlines key concepts that must be understood before the system can be assembled.

Time Estimates for Assembly
Assembly time will vary, but it shouldn't take more than 35 minutes. If these instructions appear excessively long, it is only because of the large number of pictures I've included throughout this document. The assembly process does not take as long as it appears in these instructions.

Required Abilities
The Excel 5 system is offered as a kit which requires assembly. A small amount of dexterity and physical strength will be needed to adequately assemble and tighten each fitting.

A Note About Thread Sealing Tape
All metal-to-metal connections must have sealing tape applied to the male threads. Start the process of applying thread sealing tape by holding the fitting in your right hand. Then apply the end of the tape to the threaded portion of the fitting and rotate the fitting clockwise. The fitting should be rotated in the same direction as if it were being inserted into another fitting.

No more than three layers of tape should be applied to the fitting.

Tightening Instructions
Throughout these pages, you will find three terms used to described the amount of effort that must be applied when assembling any two parts.

"Hand-Tighten" - Tighten by hand as far as possible. Do not use tools to further tighten.
"Firmly" - Use tools as required to tighten the fittings with firm but not aggressive force.
"Aggressively" - Use tools to tighten the fittings using as much force as reasonably possible.

Vacuum Gauge Handling
The vacuum gauge is a sensitive measuring instrument which contains a fragile "sensing" spring inside. Handle the gauge with care; do not drop it or allow a tool to collide with the gauge.

Brass Parts Warning
Proposition 65 Warning (Assembly Bill 1953) To California and Applicable States
Brass fittings and other products may contain chemicals known to the state of California to cause cancer, birth defects or other reproductive toxicity. Brass fittings may contain lead and are not for use with potable water.

As with any product of this nature, you should wash your hands after contact with brass parts. We provide this warning based on our knowledge concerning the possible presence of one or more such chemicals, without attempting to evaluate the level of exposure.

Help Improve These Instructions
Let me know if you find any misspellings, grammatical errors or anything that just doesn't make sense. Feel free to email me with any questions or suggestions about this article. I've spent countless hours working on the Excel 1 system and I will continue to update and improve the kit and these instructions. I look forward to your comments and suggestions.
Assembly Instructions

Before you begin, please keep in mind that there is no need to apply excessive force when tightening any of the fittings. Since this is a continuous-run vacuum press, small leaks will not affect the vacuum level created by the vacuum pump.

1. Thread sealing tape will be applied only where there will be a metal-to-metal connection. The tape is not shown in the assembly pictures for the sake of clarity. Apply sealing tape to the threads on the following items.
   a. Short Brass Pipe Nipple
   b. Brass Elbow
   c. Vacuum Valve
   d. Vacuum Bleeder
   e. Vacuum Gauge
   f. Long Brass Pipe Nipple (apply to one side only)
   g. Brass Barbed Straight Fitting (apply only to one of the three fittings included)

2. Remove and discard the nut from each of the four rubber "feet". Leave the small washer in place on each of the feet. Attach the four rubber feet to the bottom of the vacuum pump.

3. Loosely attach the short brass pipe nipple to the vacuum port (marked with a "C") on the vacuum pump.

4. Attach the brass cross to the brass nipple. Firmly tighten the cross with an 11/16" wrench. This will also tighten the brass nipple. When finished, the cross should be horizontal as shown in the picture below. This positioning is temporary and will be changed in a few moments.

5. Firmly attach the vacuum bleeder fitting to the vacuum valve using 9/16" and 18mm wrenches.

   The vacuum valve and bleeder fitting allow the user to quickly and easily adjust the amount of vacuum being applied to the project. The fitting which we call a "bleeder" can be used for many purposes. For this kit, the bleeder simply allows filtered air back into the system to lower the vacuum level on the project.
6. Firmly attach the vacuum valve to the lower opening on the brass cross and tighten it with an 18mm wrench. The valve should be oriented so the handle is facing forward when it is fully tightened.

7. Rotate the cross back to the almost-upright position leaving this part of the assembly tilted as shown in the picture below.

![Assembly Image](image1.png)

8. Next, use a 3/4" wrench to firmly attach the brass elbow to the side opening on the brass cross. An 11/16" wrench can be used on the brass cross to prevent rotating. When tight, the brass elbow should be pointing toward the back side of the pump as shown below.

![Assembly Image](image2.png)

9. Attach the vacuum gauge to the top port of the brass cross fitting using a 9/16" wrench. Do not apply force to the gauge housing and use care to avoid hitting the gauge with any tools as this will damage the sensing element inside. Firmly tighten the gauge and then stop applying turning force when the gauge is facing forward as shown in the following picture.

*If the gauge needle is not at zero, use a pair of scissors to cut off the tip of the rubber stopper on the top of the vacuum gauge.*

10. Find the long brass pipe nipple and firmly attach the side the with the thread sealing tape to the brass elbow.

*Use vice-grips for this step of the assembly. To prevent the tool from marring the soft brass surface of the pipe, consider wrapping the pipe with a few layers of masking tape.*
11. Unscrew the clear filter bowl from the black plastic filter head. Attach the filter head to the brass pipe. There is an arrow stamped the side of the filter head. Be sure the directional arrow is pointing in the direction of vacuum flow (toward the front of the system).

*Do not over-tighten the filter head. The plastic is soft and so it will easily seal against the threads on the brass fitting.*

12. The filter bowl can now be re-attached to the filter head. Hand-tight is adequate.

13. Attach the brass barbed elbow to the filter and use a 1/2" wrench to gently tighten it. It will be necessary to hold the filter in place while this elbow is tightened. Do not over-tighten this part. When finished, the fitting should be pointed in the direction shown in the picture below.

14. The composite plastic manifold can now be assembled. With a 9/16" wrench, attach a straight brass barbed fitting to each of the two end ports on the manifold. No thread sealing tape is needed on these fittings. Remember that the composite material is soft so be sure to avoid cross-threading as the fittings are attached. It may take a couple of tries to get the threading started accurately. Be sure to avoid over-tightening the fittings.

- If you opted for the standard single-hose version of the Excel 3 or Excel 5 system, you will find two brass plugs included with the parts bag. Insert a brass plug into each of the side ports on the black composite manifold using a 1/4" Allen wrench. See figure A below. No thread sealing tape is needed on these fittings.

- If you ordered your Excel kit with the optional manifold kit with quick connectors, the brass plugs mentioned above will not be used. Find the two vacuum valves and attach a lock-on connector plug fitting to each. Be sure to use thread sealing tape. Then attach the vacuum valves to the side ports on the black composite manifold. See figure B below.
15. Note the channel machined into the side of the manifold. Slide the channel of the manifold over the aluminum tube on the vacuum pump so that the shallow recess is on the top.

16. The kit includes a small piece of vacuum tube. Attach the tube to the straight barbed fitting on the manifold as shown in the picture below. Mark a line where it will be cut so that it fits between the brass barbed elbow and the straight barbed fitting on the manifold. Cut the tubing at the marked line with scissors or a razor knife.

17. When the tubing has been cut to the correct size, slide the manifold off the pump and attach the short piece of tubing to the brass barbed elbow. Then slide the manifold back on to the aluminum tube. The assembly should look like the picture below.
18. Note that there is a U-shaped protrusion on the composite handle part of your kit. Slide the protrusion over the other aluminum tube on the vacuum pump. Then press it down into the recessed area of the manifold as shown in the picture.

19. Using the provided coarse-thread screw, attach the handle to the manifold. The screw is inserted from under the manifold into the handle. A pilot hole has been pre-drilled into the handle to help with alignment. Do not over-tighten this screw.

20. Attach one end of the 10-foot piece of braided vacuum tube to the brass barbed straight fitting on the manifold.

21. Firmly attach the 1/8" NPT brass barb fitting to the lock-on connector using a 5/8" and 9/16" wrench. This fitting should have thread sealing tape applied to it.
22. Attach each of the above assemblies to the vacuum tube. A high-grade braided tube is included with the Excel kit so the barb fittings should slide in without much effort, but the tubing can be softened in hot water to make this process easier.

23. If you opted for the additional manifold kit with quick connectors, attach the 1/8” NPT brass barb fittings to the two lock-on connectors. Then attach these assemblies to the remaining end of each vacuum tube. You will finish up with two vacuum tubes that have the same lock-on connector on all four ends.

Your Excel Vacuum Pressing System Is Now Complete!
I’ve written a short but helpful article that explains what else you will need to use your vacuum press. The article also includes a step by step guide to using your system for vacuum pressing a veneered panel. Check it out here…

How to Use the Excel Vacuum Press System

Apply the bag closure to the vacuum bag when the project is prepared and placed inside. Pull back the sleeve on the lock-on connector and slide it onto the brass stem* on the vacuum bag. Release the sleeve while gently pushing downward to snap the lock-on connector into position.

Plug in the Excel vacuum press and close the vacuum valve by turning the handle to the horizontal position. The gauge will show how much vacuum is being applied to the bag. The ideal vacuum level for most veneering projects is 21” of Hg. Observe the vacuum gauge as the indicator needle moves toward this ideal vacuum level. When the needle passes the 21” of Hg mark on the gauge, slowly open the vacuum valve. Doing so will allow a small amount of air to vent back into the system and the gauge needle will move backward. Adjust the position of the vacuum valve handle until the gauge needle settles at the 21” mark. No further adjustment should be needed during the pressing time for the project.

Keep in mind that this system is designed to run continuously while the adhesive is setting up. The vacuum pump will not restart if power is removed from the system and there is any vacuum shown on the gauge. If you need to turn the system off while pressing a project, then you must temporarily disconnect the lock-on connector from the vacuum bag before turning on the pump again. When the pump is running, re-attach the connector to the bag. Failure to do this will cause the pump to stall and over-heat which can result in permanent damage to the vacuum pump.

* The vacuum bags offered at VeneerSupplies.com include a special brass stem that mates with the lock-on connector included with this vacuum press kit.

Warnings
1. Do not allow the vacuum press system to run unattended.

2. The vacuum gauge is a sensitive instrument and will be rendered inaccurate if dropped or struck with a hard object.

3. The vacuum pump may be hot during and after use. Exercise care when handling the vacuum press system.

Pressing Time
The adhesive used on your project will determine how long the panel needs to be pressed in the bag. Always follow the instructions on the adhesive bottle for clamping time. Excess clamping time for some adhesives can be problematic so avoid pressing the project for too long.

When the suggested pressing time is complete, unplug the Excel vacuum system and remove the lock-on connector from the bag by pulling back on the sleeve.

Vacuum Pressing Multiple Vacuum Bags
The optional extended kit allows you to press up to three vacuum bags at once. Begin by closing off the two auxiliary vacuum valves that are attached to the handle/manifold assembly. Attach the first bag to the system and allow it to draw vacuum. Attach the second bag to one of the auxiliary vacuum lines. Open the corresponding valve to the bag. When the gauge indicates that adequate vacuum levels have been achieved in both bags, attach the remaining auxiliary vacuum line to the third bag and open the vacuum valve. Keep an eye on the vacuum gauge and adjust the system bleeder valve as necessary to maintain the level of vacuum required for your projects.
Using the Excel System with Podz™ Vacuum Clamping Jigs
(Optional)

If you ordered your Excel system with the optional Podz™ clamping kit, assemble the jigs using the instructions included with the kit.

Begin preparing the system and Podz jigs for use by attaching the tube adapter from the lead Podz clamping jig to the lock-on connector from the Excel vacuum system. Turn the vacuum valve to the 4 o'clock position. When the system is running, this will allow a small amount of air to vent back into the system and is necessary for releasing the vacuum clamped project when the system is turned off. See the full Podz instructions for details.

Attach the power cord from the vacuum pump to the end of the power cord on the electric foot pedal that is included with the Podz clamping option for the Excel system. Plug the cord assembly into a standard 120v wall socket. Press the back side of the pedal to turn the system on. To turn the system off, press the front side of the pedal.

**How It Works**

Turn the system on via the foot pedal and place your project panel onto the Podz jigs. Adjust the vacuum valve handle as needed to create an ideal balance of vacuum clamping force and release time. The release time is the amount of time it takes for the vacuum to bleed out of the system (when it is turned off) so that the clamped project panel can be removed from the Podz jigs. Increase the clamping force by moving the vacuum valve handle toward the horizontal or 3 o'clock position but be aware that doing so can increase the amount of time it takes for the Podz jigs to release the clamped panel.

Press the back edge of the foot pedal to turn the vacuum pump on. Place the work piece onto the vacuum jig and you should feel the vacuum pressure pull the work piece solidly onto the jig. If the clamping piece is very porous and causes inadequate vacuum, you may wish to adjust the bleeder fitting to reduce the amount of air allowed back into the system.

To release the pressure from the Podz jigs, press down on the front edge of the pedal. You may hear the flow of air from the bleeder fitting as the vacuum from the jig is unloaded and the work piece is released.
